A Report on Persons with 'Disabilities' In Uttar Pradesh

Based on
Pooled Data (Central and State Sample) of 76th Round NSS Schedule 26.0
(July 2018 - December 2018)

PREFACE

The Seventy sixth round of NSS (July 2018-December 2018) was exclusively for collection of data on Persons with 'Disabilities' and 'Drinking water, Sanitation, Hygiene and Housing Condition'. The present report ***"A Report on Persons with 'Disabilities' in Uttar Pradesh"*** is prepared by pooling the data of central and state sample of NSS 76th round.

The necessity for pooling the Central and State sample data arose due to the growing need for improving the precision of estimates of policy parameters such as the labour force participation, level of living and well being, incidence of poverty, State Domestic Product (SDP), District Domestic Product (DDP) etc., and for strengthening the database at district level required for decentralized governance.

Accordingly the NSC expert committee has recommended certain poolability tests and the methodologies for pooling of Central and State sample. Pooling software received on 4th Oct, 2023 from DPD, Kolkata, NSO, Govt. of India for poolability tests and pooling of two sets of data and estimating the parameters based on two methods- (1) Matching ratio method and (2) Inverse Weight of the Variance of estimates method. The Directorate is thankful to NSSO for providing their valuable technical guidance and pooling software.

This report has been prepared on pooled estimates of Central and State sample data of NSS 76th round on various parameters of **Persons with 'Disabilities'** *e.g* classification of persons with disabilities, No. of household members of age 12 to 59 years with disability, employment and unemployment particulars of disable persons, education status, out-of-pocket expenses relating to disability, etc. Comments and valuable suggestions from the researchers and scholars on this report are most welcome.

Date : 02-05-2024

CHAPTER 1
INTRODUCTION

1.0 Background

The National Sample Survey (NSS) was set up in 1950, to bridge large gaps in statistical data needed for planning, policy formulation and computation of national income aggregates, especially in respect of the unorganized and household sector of the economy. NSSO has been conducting nation wide multi-subject, integrated, large scale sample surveys in the form of successive rounds covering various aspects of social, economic, demographic, industrial and agricultural statistics. The Seventy sixth round of NSSO (July 2018-December 2018) was devoted exclusively for collection of data on "**Survey of Persons with Disabilities**" and "**Drinking Water, Sanitation, Hygiene and Housing Condition**".

1.1 Objective

1.1.1 Survey of Persons with Disabilities

The main objective of this survey was to estimate indicators of incidence and prevalence of disability, cause of disability, age at onset of disability, facilities available to the persons with disability, difficulties faced by persons with disability in accessing public building/public transport, arrangement of regular care giver, out-of pocket expense relating to disability, etc. Further, estimates could be obtained on various employment and unemployment particulars in usual status for the household members with at least one disability. For each of the household members of age 12 to 59 years, information was collected on whether receiving/received vocational/technical training. Also, for the household members with at least one disability who received formal vocational/technical training, information was collected on field of training, duration of training, type of training, source of funding the training, etc.

1.1.2 Survey on Drinking Water, Sanitation, Hygiene and Housing Condition

Facilities of drinking water, sanitation along with housing facilities available to the households and the micro environment surrounding the houses are important determinants of overall quality of living condition of the people of the country. The survey on 'Drinking Water, Sanitation, Hygiene and Housing Condition' aims to collect information on all these aspects. Some of the important items on which information was collected through this survey were: 'type of the dwelling unit' (viz. independent house, flat etc.), 'tenurial status of the dwelling unit' (viz. owned, hired, no dwelling etc.), 'structure of the dwelling unit' (viz. pucca, semi-pucca, katcha), 'condition of the structure' (viz. good, satisfactory, bad), 'floor area of the dwelling unit', 'age of the house owned by the household', facilities available to the households in respect of drinking water, bathroom, latrine etc. and micro environment surrounding the house like 'drainage system of the house', 'system of disposal of household waste water', 'system of disposal of household garbage', 'problems of flies and mosquitoes' etc.

1.2 State's participation in NSS surveys

Uttar Pradesh state is participating in the NSS surveys since 9th round (1955) onwards by using the same concepts, definitions and procedures and by adopting the same sample design based on independently drawn sample as that of NSSO called as the state samples.The sample list of the state sample was drawn and supplied by the NSSO. District wise sample size for 76th round for state is given as in Annexure-1.

1.3 Objective of pooling

One of the objectives of States participation in the NSS surveys is to provide a mechanism by which sample size would be increased and the pooling of the two sets of data would enable better estimates at lower sub state level, particularly at district level. This will result in increased precision of the

estimates at disaggregated level, estimates will be more stable. But the major benefit will be derived in the case of estimates generated at sub-state level like NSS region/districts.

1.4 Emerging needs for pooling of central and state samples

The 73rd and 74th constitutional amendment (1992) has brought into existence the democratically elected grassroots institutions of local self-governance, with respective delegated functions, both in rural and urban areas. This has enhanced the demand for local level statistics and necessitated requirement of developing basic capabilities at grass root levels to organize such statistics in a harmonious manner. In this context, it is envisioned that the survey resources in overall NSS programme both by Central and State agencies can be more effectively utilized to generate lower level estimates of key indicators at district level. The 13th Finance Commission, in Para 12.99 of its report, noted that "Comparable estimates of district income are extremely relevant for measuring intra-state income disparities. This will enable state governments to effectively plan policy and programme interventions. They could also be used as a parameter for horizontal distribution of fiscal transfers". The Commission also recommended for granting finance to state governments, which should be utilized by them for strengthening statistical infrastructure at the district level. These requirements are subsequently brought in institutional framework in the implementation of the 13th Finance Commission. The National Statistical Commission (NSC) in its reports has to also observe the importance of pooling as follows:

"The statistical agencies of different State governments have been participating in the NSS programme and canvassing the same questionnaires in matched samples of households in their respective States following identical concepts, definitions and procedures. Results from the central samples and state sample(s) have occasionally been compared. The main purpose of the programme is to pool the two samples and obtain dependable estimates for regions within the States."

1.5 Harmonization of data processing process:

The harmonization of data processing process is one of the key essences for pooling the different sets of data. The state sample data should be processed using the same set of validation rules as in the case of central sample data. Accordingly, it is essential that the state sample data is processed, ensuring the use of same data entry layout as in the case of central sample. If the states are evolving their own data layout, as per their convenience, then the state data should be put in the layout, harmonized of that with the central sample data for using the same software developed for central samples. Till 69thround, Uttar Pradesh has used his own developed data entry, validation and tabulation softwares for their reports. But in case of pooling, Uttar Pradesh has recasted their data on the layout according to the central and validated accordingly. After that pooling exercise was done using software supplied by the NSSO (DPD). From 70th round onwards Uttar Pradesh is using the data entry, validation and tabulation software supplied by the NSSO (DPD).Therefore, the question of harmonization of data processing process will not arise from 70th round and onward in UP.

1.6 Parameters considered for pooling of two sets of data:

Considering the smaller sample size at district level following standard parameters were considered for pooling.

a) Percentage (0.0) distribution of persons by broad type of disability for all age
b) Percentage (0.0) of persons with disability by status of treatment taken for different broad type of disability.
c) Percentage of persons (P) with disabilities incurring out-of-pocket expenses and average monthly out-of-pocket expenses(A) (in whole number of Rupees) per person with disability incurring expenditure on disability
d) Percentage (0.0) distribution of persons of age group 15 years and above with different broad type of disability by activity status in usual status (ps+ss)

1.7 Methodology of pooling:

Two alternate methods are used in pooling of the central and state sample data.

a) Weighting by Matching ratio: Building aggregate estimate of pooled sample in proportion to matching ratio *m: n* of central and state sample aggregate estimate where *m* and *n* are the allotted sample for central and state sample separately for rural and urban sector. Building ratio estimate of pooled sample as ratio of aggregate estimates.

b) Weighting by inverse of variance: Ratio estimates are built by weighting the ratio estimate of central and state sample in proportion to inverse of variance of ratio of the central and state sample estimates.

1.8 Tables generated:

Following tables were generated pertaining to the estimation of different parameters and their RSEs (%);

a) Percentage (0.0) distribution of persons by broad type of disability for all age
b) Percentage (0.0) of persons with disability by status of treatment taken for different broad type of disability.
c) Percentage of persons (P) with disabilities incurring out-of-pocket expenses and average monthly out-of-pocket expenses(A) (in whole number of Rupees) per person with disability incurring expenditure on disability
d) Percentage (0.0) distribution of persons of age group 15 years and above with different broad type of disability by activity status in usual status (ps+ss)

1.9 Sample size of Uttar Pradesh:

The sample and estimated data of central and state samples for Uttar Pradesh state is given below in Table 1.

Table 1: FSU's Surveyed and estimates of Households and Persons regarding Central and State samples and Pooled data

Source	FSU surveyed		Estimated HH(00)			Estimated Persons(000)

CHAPTER 2
SUMMARY OF FINDINGS

2.0 INTRODUCTION

The theoretical framework of pooling and the methodology as well as issues concerning operational and technical aspects of pooling of NSS central and state sample data are given in chapter 3.

This chapter focuses the results obtained after performing poolability test for different parameters to which data collected in Schedule 26.0. The Run Test performed over Percentage of persons (P) with disabilities incurring out-of-pocket expenses and average monthly out-of-pocket expenses(A) (in whole number of Rupees) per person with disability incurring expenditure on disability, Percentage (0.0) distribution of persons of age group 15 years and above with different broad type of disability by activity status in usual status (ps+ss), Percentage (0.0) distribution of persons by broad type of disability for all age, Percentage (0.0) of persons with disability by status of treatment taken for different broad type of disability. Number of districts for which poolability was rejected by the above mentioned tests are given below.

2.1 POOLABILITY TEST RESULT (BY χ^2 TEST):

The Chi Square Test performed over (1) persons by broad type of disability for all age, (2) persons with disability by status of treatment taken for different broad type of disability, (3) persons of age group 15 years and above with different broad type of disability by activity status in usual status (ps+ss).Poolability test results are given below in table 2.1.1

Table 2.1.1: Number of Districts for which poolability was rejected by Chi-square TEST.

Chi-square Test Results			
Type	**No. of Districts for which poolability was rejected**		**Total number of Districts**
	Rural	**Urban**	
persons by broad type of disability for all age	9	4	71
persons with disability by status of treatment taken for different broad type of disability	15	8	71
persons of age group 15 years and above with different broad type of disability by activity status in usual status (ps+ss)	15	02	71

The above table shows that in rural part of 71 districts, 15 districts did not satisfy the poolability test for 'persons of age group 15 years and above with different broad type of disability by activity status in usual status (ps+ss)' whereas in urban part of 71 districts, 02 districts did not satisfy the poolability test for 'persons of age group 15 years and above with different broad type of disability by activity status in usual status (ps+ss)'.Similary in the case of 'persons by broad type of disability for all age' 9 districts of rural and 4 districts of urban sector out of 71 districts did not satisfy the poobalility test. In case of 'persons with disability by status of treatment taken for different broad type of disability',15 districts of rural and 8 districts of urban out of 71 districts did not satisfy the poobalility test.

2.2 POOLABILITY TEST RESULT (BY RUN TEST):

The Run Test performed over 'Average monthly out-of-pocket expenditure on disability per person'. Poolability test results are given below in table 2.2.1

Table 2.2.1: Number of Districts for which poolability was rejected by RUN TEST using Z-statistics (one-sided).

Type	Sector		Total number of Districts
	Rural	Urban	
Run Test Results			
Average monthly out-of-pocket expenses on disability per person	0	0	71

The above table shows that no districts were rejected by the RUN test of the poolability test for 'Average monthly out-of-pocket expenditure on disability per person' in both rural and urban sector.

2.3 Distribution (No.) of districts by different range of RSEs (%) for various parameters

Before pooling the two sets of sample at a particular domain and classification, one needs to examine the divergence of the estimates derived for the domain. For this exercise, district is considered as domain of pooling and the divergence is worked out as absolute percentage difference between central and state sample estimates. The distribution of districts (No. of districts) by range of percentage divergence (RSE) for different parameters are shown in the following tables.

2.3.1 Distribution (No.) of districts by different range of RSE(%)

Table 2.3.1(i): Distribution of districts: Percentage (0.0) distribution of persons by broad type of disability (locomotor) for all age.

Item	<=5%	5-10%	10-15%	15-20%	20-25%	25-30%	>30%	Total Districts
CENTRAL SAMPLE								
Rural	2	31	28	8	1	1	0	71
Urban	12	12	16	18	3	5	5	71
ALL	3	38	22	7	1	0	0	71
STATE SAMPLE								
Rural	0	27	31	6	3	0	4	71
Urban	9	9	22	14	10	3	4	71
ALL	2	37	20	8	1	1	2	71
POOLED SAMPLE (MR)								
Rural	2	54	11	3	1	0	0	71
Urban	7	27	22	10	3	0	2	71
ALL	5	57	7	2	0	0	0	71
POOLED SAMPLE (IV)								
Rural	5	59	6	0	0	0	1	71
Urban	18	27	15	8	1	0	2	71
ALL	7	59	4	0	0	0	1	71

The above table shows that districts with more than 20% divergence in central sample have 02 rural (2.82%) and 13 urban (18.31%) districts from out of 71 districts.Similarly districts with more than 20% divergence in state sample have 07 rural (9.86%) district and 17 urban (23.94%) district from out of 71 districts, In pooled sample (MR) have 01 rural (1.41%) district and 05 urban (7.04%) district from out of 71 districts and in pooled sample (IV) have 01 rural (1.41%) and 03 urban (4.23%) districts from out of 71 districts respectively.

Table 2.3.1(ii): Distribution of districts: Percentage (0.0) distribution of persons by broad type of disability (Visual) for all age.

Item	<=5%	5-10%	10-15%	15-20%	20-25%	25-30%	>30%	Total
CENTRAL SAMPLE								
Rural	0	0	0	0	0	0	71	71
Urban	8	0	0	0	0	0	63	71
ALL	0	0	0	0	0	0	71	71
STATE SAMPLE								
Rural	0	0	0	0	0	0	71	71
Urban	13	0	0	0	0	0	58	71
ALL	0	0	0	0	0	0	71	71
POOLED SAMPLE (MR)								
Rural	0	0	0	0	0	2	69	71
Urban	2	0	0	0	0	1	68	71
ALL	0	0	0	0	0	4	67	71
POOLED SAMPLE (IV)								
Rural	0	2	4	6	6	8	45	71
Urban	19	0	0	0	0	0	52	71
ALL	0	0	0	0	0	3	68	71

The above table shows that districts with more than 20% divergence in central sample have 71 rural (100%) and 63 urban (88.73%) districts from out of 71 districts. Similarly districts with more than 20% divergence in state sample have 71 rural (100%) district and 58 urban (81.69%) district from out of 71 districts, In pooled sample (MR) have 71 rural (100%) district and 69 urban (97.18%) district from out of 71 districts and in pooled sample (IV) have 59 rural (83.10%) and 52 urban (73.24%) districts from out of 71 districts respectively.

Table 2.3.1(iii): Distribution of districts: Percentage (0.0) distribution of persons by broad type of disability (Hearing) for all age.

Item	<=5%	5-10%	10-15%	15-20%	20-25%	25-30%	>30%	Total
CENTRAL SAMPLE

CHAPTER 3
TESTING POOLABILITY AND METHODOLOGY FOR POOLING

3.1 TESTING POOLABILITY

Though the central and state sample are drawn independently following identical sampling design with same concepts, definitions and instructions to collect the state sample data but due to lack of adequate training of field and processing staff of state DESs, unit level data in some cases may not be properly validated. There may also expected agency bias in the two sets of data generated by different agencies. As such they cannot be merged for generating pooled estimate without testing that the samples are realized from identical distribution function. Since the parametric distribution of the sample mean is unknown one may adopt non-parametric tests such Run test, Median test, chi-square test etc to test that the samples are coming from identical **distribution** function.

3.1.1MEDIAN TEST

3.1.1.1 In statistics, the Median test is a special case of Pearson's Chi-square test. It tests the null hypothesis that the medians of the populations from which two samples are drawn, are identical. Observations in each sample are assigned to two groups, one consisting of data whose values are higher than the median value in the two groups combined, and the other consisting of data whose values are at the median or below. A Pearson's Chi-square test is then used to determine whether the observed frequencies in each group differ from expected frequencies derived from a distribution combining the two groups.

Let m^* be the median of the pooled sample data. Construct 2 X 2 contingency table as below and use chi-square test if State sample and Central sample have identical median.

Sample-type	**no of sample observation**		**Total**
	<= m^*	**> m^***	
State Sample	N_{11}	N_{12}	$N_{1.}$
Central Sample	N_{21}	N_{22}	$N_{2.}$
Total	$N_{.1}$	$N_{.2}$	$N_{..}$

Observed frequency of each cell $O_{ij} = N_{ij}$ where i= 1 to 2, j= 1 to 2.

Expected frequency of each cell $E_{ij} = (N_{i.} * N_{.j})/N_{..}$ where i= 1 to 2, j= 1 to 2.

χ^2 **Value =** $\sum_{i=1}^{2}\sum_{j=1}^{2}(O_{ij}-E_{ij})^2/O_{ij}$ **with degrees of freedom = (2-1)*(2-1) = 1**

The statisticalpower of this test may sometimes be improved by using a value other than the median to define the groups say quintile classes– that is, by using a value which divides the groups into more nearly equal groups than the median would.

3.1.2MULTINOMIAL DISTRIBUTION TEST OR χ^2 TEST

For discrete data such as status of activity, educational level and categorical variable such as land possedetc, standard tests of equality of sample proportions of two sets of data based on multinomial distributions, relevant chi-square tests may be used after grouping the attributes/categorical variables in to a suitable number of classes so that each class contains adequate number of sample observations. Construct 2 X k contingency table for k classes at the domain where two sets of data are to be pooled as below and use chi-square test if State sample and Central sample have identical distribution.

Sample-type	no of sample observation					Total
	Class-1	Class-2	...	Class-k-1	Class-k	
State Sample	N_{11}	N_{12}	...	N_{1k-1}	N_{1k}	$N_{1.}$
Central Sample	N_{21}	N_{22}	...	N_{2k-1}	N_{2k}	$N_{2.}$
Total	$N_{.1}$	$N_{.2}$	...	$N_{.k-1}$	$N_{.k}$	$N_{..}$

Observed frequency of each cell $O_{ij}= N_{ij}$where i= 1 to 2, j= 1 to k.

Expected frequency of each cell $E_{ij}= (N_{i.} * N_j)/N_{..}$where i= 1 to 2, j= 1 to k.

χ^2 **Value =** $\sum_{i=1}^{2}\sum_{j=1}^{2}(O_{ij}-E_{ij})^2/O_{ij}$ **with degrees of freedom = (2-1)*(k-1) = k-1**

3.1.3 WALD-WOLFOWITZ RUN TEST

3.1.3.1 Suppose X and Y are independent random samples with cumulative distribution function (CDF) as $F_s(x)$ and $F_c(y)$. Null Hypothesis to be tested is $H_{0:}$ $F_s(x) = F_c(x)$ for all x against alternative Hypothesis is H_1: $F_s(x) <= F_c(x)$ for all x and $F_s(x) < F_c(x)$for some x. Let $x_1,x_2,\ldots..,x_m$ be iid observation from state sample with distributive function $F_s$and$y_1,y_2,\ldots..,y_n$ be iid observation from central sample with distribution function $F_{c.}$ Pool the data and order them with respect to comparable characteristic under consideration say monthly per capita expenditure (MPCE). In the pooled order sequence put "1" for X and "0" for Y. Let U be the total runs observed where 'run' is a sequence of adjacent equal symbols. For example, following sequence: 11110001110011111110000 is divided in six runs, three of them are made out of "1" and the others are made out of "0". The number of runs U is a random variable whose distribution for large sample can be treated as normal with:

mean: $\frac{2mn}{m+n}+1$ **variance:** $\frac{2mn(2mn-m-n)}{(m+n)^2(m+n-1)}$

After normalizing the variable U one may use one sided z-test for testing the Null hypothesis. In extreme case the value of U will be 2 meaning by observed characteristic of all the observation of one sample is less than the other samples.

3.1.3.2 One of the limitations of this test is when there is a tie between two samples in the observed value. One has to resolve ties in usual manner. However if there is large number of ties which is bound to occur specially for qualitative attributes like education level, activity status etc, this test is not recommended. This test can be well applied for a continuous variable such as MPCE which are less prone to ties. For discrete variable chi-square test is recommended.

3.1.4 PARAMETRIC TEST

3.1.4.1 AGGREGATE ESTIMATE: Let t_{yc}andt_{ys}be theestimate of Y at domain level of pooling based on central and state sample respectively with corresponding variances V(t_{yc}) and V(t_{ys}). For large sample, making all assumption of parametric test, one may use Z-Statistic to test the null hypothesis H_0 E(t_{yc}) = E(t_{ys}) where E stands for expectation.

$$\mathbf{Z=}\ \frac{(t_{yc}-t_{ys})}{\sqrt{(V(t_{yc})+V(t_{ys}))}}$$

$V(t_{yc})$ and $V(t_{ys})$ could be estimated as

$\hat{V}(t_{yc}) = \sum_l (t_{yc1} - t_{yc2})^2/4$, $\hat{V}(t_{ys}) = \sum_l (t_{ys1} - t_{ys2})^2/4$ based on sub-sample 1 & 2 estimates where $\sum_l$ stands for summing over stratum x sub-stratum level variance at the domain of pooling.

3.1.4.2 ESTIMATE OF RATE: Let r_c and r_s be the estimate of population rates R_c and R_s ieY/X based on central and state sample respectively with corresponding mean square error MSE(r_c) and MSE (r_s). For large sample, making all assumption of parametric test, one may use Z-Statistic to test the null hypothesis H_0:E(r_c)=E(r_s) where E stands for expectation.

$$\mathbf{Z}= \frac{(r_c - r_s)}{\sqrt{(MSE(r_c) + MSE(r_s))}}$$

MSE(r_c) and MSE(r_s) are estimated as follows:

$mse(r_c) = (\hat{V}(t_{yc}) - 2 * r_c \hat{Cov}(t_{yc}, t_{xc}) + r_c^2 * \hat{V}(t_{xc}))/ t_{xc}^2$

$mse(r_s) = (\hat{V}(t_{ys}) - 2 * r_s \hat{Cov}(t_{ys}, t_{xs}) + r_s^2 * \hat{V}(t_{xs}))/ t_{xs}^2$

where

$\hat{V}(t_{yc}) = \sum_l (t_{yc1} - t_{yc2})^2/4$, $\hat{V}(t_{ys}) = \sum_l (t_{ys1} - t_{ys2})^2/4$

$\hat{V}(t_{xc}) = \sum_l (t_{xc1} - t_{xc2})^2/4$, $\hat{V}(t_{xs}) = \sum_l (t_{xs1} - t_{xs2})^2/4$

$\hat{Cov}(t_{yc}, t_{xc}) = \sum_l (t_{yc1} - t_{yc2})(t_{xc1} - t_{xc2})/4$ based on sub-sample 1 & 2 estimates

where $\sum_l$ stands for summing over stratum**x**sub-stratum level variance, covariance at the domain of pooling.

3.2 METHODOLOGY FOR POOLING

3.2.1 POOLING BY INVERSE WEIGHT OF THE VARIANCE OF THE ESTIMATES

3.2.1.1 AGGREGATE ESTIMATE: For any characteristic, consider the state sample [s] in the form of two independent sub- sample s1 and s2 and the central sample [c] in the form of two independent sub- sample c1 and c2. Based on this, the respective estimates for state and central can be computed as:

$t_s = \sum_l (t_{s1} + t_{s2})/2$ and

$t_c = \sum_l (t_{c1} + t_{c2})/2$

Pooled estimate leading to optimum combination of these two estimates is given by weighing with inverse of the variance of the estimate. Thus the pooled estimate is given by:

$$T_p = \frac{V(t_c)t_s + V(t_s)t_c}{V(t_c) + V(t_s)} \text{ with } V(T_p) = \frac{V(t_c)V(t_s)}{V(t_c) + V(t_s)}$$

In general $V(t_c)$ and $V(t_s)$ are unknown and can be estimated as

$$\hat{V}(t_c) = \sum_l (t_{c1} - t_{c2})^2/4, \quad \hat{V}(t_s) = \sum_l (t_{s1} - t_{s2})^2/4$$

where $\sum_l$ stands for summing over stratum x sub-stratum level variance at the domain of pooling.

Thus pooled estimate and estimate of pooled variance is given by

$$t_p = \frac{\hat{V}(t_c)t_s + \hat{V}(t_s)t_c}{\hat{V}(t_c) + \hat{V}(t_s)}, \quad \hat{V}(t_p) = \frac{\hat{V}(t_c)\hat{V}(t_s)}{\hat{V}(t_c) + \hat{V}(t_s)}$$

By virtue of weighing the two estimates at the domain level at which two estimates are pooled, the pooled estimate will always lie between the central and state sample estimates.

3.2.1.2 ESTIMATE OF RATE/RATIOS: Let r_c and r_s be the estimate of R_c and R_s ie Y/X based on central and state sample respectively with corresponding estimated mean square error mse(r_c) and mse (r_s). The pooled estimate and estimate of variance of pooled ratio estimate may be given by:

$$r_p = \frac{mse(r_c)r_s + mse(r_s)r_c}{mse(r_c) + mse(r_s)}, \quad mse(r_p) = \frac{mse(r_c)\,mse(r_s)}{mse(r_c) + mse(r_s)}$$

Where mse(r_c) and mse(r_s) are calculated using formula given in para 3.1.4.2 above. Alternatively one can generate the pooled estimate of aggregate by inverse weight of estimate of variance obtained from central and state sample using formula given in para 3.2.1.1 for the

characteristics x as well as y and obtain the pooled estimate of ratio as ratio of pooled estimate of aggregate. This will ensure consistency between pooled estimates of aggregate and the pooled estimate of ratio.

Let $t_{xp}$and t_{yp}be the pooled estimate of aggregate for the parameter X and Y. The pooled estimate of R (i.e Y/X) is given by

$r_{p=}\ t_{yp}/t_{xp}$

where$t_{yp}= at_{yc}+ bt_{ys}$ and $t_{xp}= ct_{xc}+ dt_{xs}$ and (a, b), (c, d) are the estimated inverse variance weight pair of the characteristic x and y respectively.

The estimated mse of pooled ratio estimate $r_p$is given by:

$$mse(r_p) = (\hat{V}(t_{yp}) - 2\ r_p \hat{Cov}(t_{yp}, t_{xp}) + r_p^2 \hat{V}(t_{xp}))/ t_{xp}^2$$

where $\hat{V}(t_{yp}) = \frac{ab}{a+b}$, $\hat{V}(t_{xp}) = \frac{cd}{c+d}$ and

$\hat{Cov}(t_{yp}, t_{xp}) = ac\,\hat{Cov}(t_{yc}, t_{xc}) + bd\,\hat{Cov}(t_{ys}, t_{xs})$.

$\hat{Cov}(t_{yc}, t_{xc}) = \sum_l (t_{yc1} - t_{yc2})(t_{xc1} - t_{xc2})/4$ based on sub-sample 1 & 2 estimates.

Similarly, $\hat{Cov}(t_{ys}, t_{xs}) = \sum_l (t_{ys1} - t_{ys2})(t_{xs1} - t_{xs2})/4$

where $\sum_l$ stands for summing over stratum x sub-stratum level covariance at the domain of pooling.

Method laid down in para 3.2.1.1 requires calculation of estimate of variance of the estimates before pooling them. Reliability of estimate of variance should be ascertained with due consideration of sample size.Besides the complex calculations of variances and covariances for each cell of the table, one needs to address the issue of non-additivity of the component estimates with the estimate of marginal total. For e.g. pooled estimate of MPCE of FOOD and NON-FOOD may not add up to MPCE of TOTAL. To obviate this problem one may generate the pooled estimates of components first and then derive the estimate of total as sum of estimates of components.

3.2.2 POOLING BY SIMPLE AVERAGE OF THE ESTIMATES

When the state's participation is equal matching of central samples, the simple average of two estimates may be a way of combining the estimates considering central and state samples as independent samples. The pooled estimate will always lie between the estimates based on central and state sample separately.

When the state's participation is of unequal matching of central samples, the weighted average of two estimates with weights being matching ratio of central and state sample may be a better way of combining the estimates considering central and state samples as

independent samples. For any characteristic, consider the state sample [s] in the form of two independent sub-sample s1 and s2 and the central sample[c] in the form of two independent sub- sample c1 and c2. Let matching ratio of state and central sample be m : n. Based on this, the respective estimates for state and central can be computed as:

$t_s = \sum_l (t_{s1} + t_{s2})/2$ and $t_c = \sum_l (t_{c1} + t_{c2})/2$

Pooled estimate of these two estimates is given by weighing with matching participation rate m:n. Thus the pooled estimate is given by:

$$t_p = \frac{mt_s + nt_c}{m+n} \text{ with } V(t_p) = \frac{m^2 V(t_s) + n^2 V(t_c)}{(m+n)^2}$$

In general $V(t_c)$ and $V(t_s)$ can be estimated as $\hat{V}(t_c) = \sum_l (t_{c1} - t_{c2})^2/4$,

$\hat{V}(t_s) = \sum_l (t_{s1} - t_{s2})^2/4$ and thus $\hat{V}(t_p) = \frac{m^2 \hat{V}(t_s) + n^2 \hat{V}(t_c)}{(m+n)^2}$

The pooled estimate will always lie between the estimates based on central and state sample separately.

3.2.3 SUMMING UP: For those characteristics which are known to be distributed as Normal, poolability of the two sets of central and state data may be tested by standard parametric tests such as Z-test. For those characteristics for which transformation makes them Normal, such methodology may be adopted. In most of the situations where the distribution is non-normal and unknown, the two sets of data may be tested through various non-parametric tests such as those laid down in starting paras and subparas of present chapter. For discrete data, standard tests of equality of proportions based on binomial distribution may be used and for multinomial distributions relevant chi-square tests may be used

-ꕥ-

CHAPTER-4
POOLABILITY TEST

Table 4.1: Districtwise result of Chi-square test of Disable persons (all ages) with Locomotor disability for pooled sample.

ANNEXURE-II Schedule of Enquiry

RURAL		*
URBAN		

GOVERNMENT OF INDIA
NATIONAL SAMPLE SURVEY OFFICE
SOCIO-ECONOMIC SURVEY

SEVENTY-SIXTH ROUND: JULY, 2018 - DECEMBER, 2018

SCHEDULE 26: SURVEY OF PERSONS WITH DISABILITIES

CENTRAL		*		
STATE				

[0] descriptive identification of sample household			
1. state/u.t.:	5. investigator unit number /block number:		
2. district:	6. sample sub-unit (SU) number		
3. sub-district/tehsil/town*:	7. name of head of household:		
4. village name:	8. name of informant:		

[1] identification of sample household					
item no.	item	code	item no.	item	code
1.	srl. no. of sample FSU		6.	serial number of informant # (as in column 1 of block 3)	
2.	round number	7 6	7.	response code	
3.	schedule number	2 6	8.	survey code	
4.	second-stage stratum number		9.	reason for substitution of original household (code)	
5.	sample household number				

CODES FOR BLOCK 1

item 7: ***response code***: informant: *co-operative and capable -1, co-operative but not capable -2, busy -3, reluctant -4, others -9.*
item 8: ***survey code***: *original -1, substitute -2, casualty -3.*
item 9: ***reason for substitution of original household***: *informant busy -1, members away from home -2, informant non-cooperative -3, others -9.*

** tick mark (√) may be put in the appropriate place.*
 # if the informant is not a household member, code 99 will be recorded.

[3] demographic and other particulars of household members								
srl. no.	name	relationship to head (code)	whether the parents are blood-related (code)	gender (code)	age (years)	marital status (code)	highest level of education (code)	highest level of technical education (code)
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)

CODES FOR BLOCK 3

col. (3)*:* ***relation to head:*** *self -1, spouse of head -2, married child -3, spouse of married child -4, unmarried child -5, grandchild -6, father/mother/father-in-law/mother-in-law -7, brother/sister/brother-in-law/sister-in-law/other relatives -8, servants/ employees/ other non-relatives -9*

col. (4)*:* ***whether the parents are blood-related***: *yes – 1, no – 2, not known – 3*

col. (5)*:* ***gender****: male-1, female-2, transgender-3*

col. (7)*:* ***marital status:*** *never married – 1, currently married – 2, widowed – 3, divorced/separated – 4*

col. (8) : highest level of education: *not literate -01, literate without any schooling -02, literate without formal schooling: through NFEC -03, through TLC/ AEC -04, others -05; literate with formal schooling: below primary -06, primary -07, upper primary/middle -08, secondary -10, higher secondary -11, diploma /certificate course (upto secondary)-12, diploma/certificate course(higher secondary)-13, diploma/certificate course(graduation & above) -14, graduate -15, post graduate and above -16.*

col. (9): highest level of technical education: *no technical education -01,* technical degree in*: agriculture -02, engineering/ technology -03, medicine -04, crafts -05, other subjects -06;* technical diploma or certificate (below graduate level) in*: agriculture -07, engineering/ technology -08, medicine -09, crafts -10, other subjects -11;* technical diploma or certificate (graduate and above level) in*: agriculture -12, engineering/ technology -13, medicine -14, crafts -15, other subjects -16.*

[4] household characteristics			
1.	household size		
2.	religion (code)		
3.	social group (code)		
4.	land possessed as on date of survey (code)		
household's usual monthly consumer expenditure (Rs.)			
5.	usual consumer expenditure in a month for household purposes out of purchase (A)		
6.	imputed value of usual consumption in a month from home grown stock (B)		
7.	imputed value of usual consumption in a month from wages in kind, free collection, gifts, etc. (C)		
8.	expenditure on purchase of household durables **during last 365 days** (D)		
9.	usual monthly consumer expenditure **[A + B + C +(D/12)]**		
Note: ***1. For recording information in items 5, 6 and 7, usual monthly consumption will mean expenditure is incurred/consumption took place with a monthly regularity.*** ***2. Ensure that the figures reported in item 5 are not reported again in any of the items 6, 7 or 8.***			

CODES FOR BLOCK 4

item 2: religion *: Hinduism-1, Islam-2, Christianity –3, Sikhism-4, Jainism-5, Buddhism-6, Zoroastrianism-7, others-9*
